The global CCD Sensor market size is predicted to grow from US\$ 657 million in 2025 to US\$ 985 million in 2032; it is expected to grow at a CAGR of 5.9% from 2026 to 2032.

CCD sensor is a charge coupled device image sensor, which is a semiconductor imaging device that converts light signals into charge signals and forms image data through charge transfer, readout amplification, and analog-to-digital conversion. Its core structure usually includes a photosensitive pixel array, charge storage area, transfer gate, readout register, output amplifier, and packaging window, etc. It has the characteristics of good imaging uniformity, low noise, high dynamic range, high sensitivity, and low image distortion. CCD sensors can be divided into area array CCD, line array CCD, TDI line array CCD, full frame transfer CCD, frame transfer CCD, inter line transfer CCD, black and white CCD, color CCD, ultraviolet enhanced CCD, near-infrared enhanced CCD, etc. They are mainly used in industrial inspection, scientific imaging, astronomical observation, spectral analysis, medical imaging, aerospace remote sensing, security monitoring, microscopic imaging, and high-end machine vision fields. In 2025, global CCD Sensor production reached approximately 17.68 M Units, with an average global market price of around US\$ 38 per unit.

CCD sensors belong to mature image sensor technology, and the overall market has shifted from large-scale applications of consumer cameras, security monitoring, and ordinary industrial cameras to specialized sub scenarios such as scientific instruments, aerospace remote sensing, spectral analysis, astronomical observation, medical imaging, and high-end industrial detection. CMOS and sCMOS image sensors, with their advantages of low power consumption, high integration, high frame rate, low cost, and supply chain expansion, are continuously replacing traditional CCDs. Recent scientific imaging research has also pointed out that modern sCMOS has become an important alternative to CCDs in terms of low readout noise, high dynamic range, and

faster frame rate. However, CCD still has value in low noise, pixel consistency, large pixel size, high dynamic range, and some special spectral response scenarios, especially in aerospace payloads, astronomical telescopes, Raman spectroscopy, fluorescence imaging, electron microscopy imaging, and highly reliable industrial testing, which still maintain stable demand. The future market will not be dominated by large-scale consumption of electronic products, but will be characterized by small batches, high unit prices, long lifespan, high reliability, and customization. The focus of enterprise competition will be on low-noise readout, back illuminated processes, large target area arrays, deep refrigeration packaging, irradiation reliability, long-term supply, and joint verification capabilities with scientific instruments and aerospace customers.
