The global CCS Integrated Busbar market size is predicted to grow from US\$ 4538 million in 2025 to US\$ 12044 million in 2032; it is expected to grow at a CAGR of 15.0% from 2026 to 2032.

CCS Integrated Busbar is one of the core components of new energy battery packs. It consists of signal acquisition components (such as wiring harnesses, FPCFFC, etc.), plastic structural parts, and copper/aluminum busbars, connected into a single unit through processes such as thermoforming or riveting. This enables high-voltage series and parallel connection of battery cells, as well as battery temperature and cell voltage sampling. It is part of the BMS (Battery Management System) and can be used in new energy power batteries, energy storage batteries, and other fields. Compared to traditional wiring harness busbars, CCS integrated busbars are lightweight, integrated, precise, and safe, improving battery pack space utilization and assembly efficiency, and meeting the demands of new energy batteries for higher energy density, higher safety, and automated assembly. With the continuous development of power battery integration technology for new energy vehicles and the accelerated application in the energy storage field, driven by factors such as automation, cost reduction, and efficiency improvement, CCS technology is currently showing a diversified development trend. Information acquisition solutions include wiring harnesses, PCBs, FPCs, FFCs, and FDCs, while integration processes include injection molding brackets, vacuum forming, hot pressing, and die-cut PCs. Meanwhile, the industry is constantly innovating, with new solutions such as FCC sampling components, SMT-free FPC/CCS, and intelligent CCS emerging. In 2025, the global CCS Integrated Busbar production capacity is projected to reach 223 million units, with an average price of approximately US\$20.8 per unit and a gross profit margin of approximately 26.86%. Koson Technology has an annual CCS busbar production capacity of 3 million units, while Huichuangda has an

annual CCS module production capacity of 12 million units. The upstream industry includes FPC/PCB manufacturers, copper and aluminum busbar manufacturers, plastic structural component manufacturers, and equipment manufacturers; the downstream includes new energy vehicles and energy storage sectors.

With the accelerated global electrification and energy transition, the CCS (Cells Contact System) integrated busbar, as a key module for cell connection, signal acquisition, and safety management within power batteries and energy storage systems, is evolving from a simple 'conductive connector' into a system-level component integrating current distribution, voltage/temperature acquisition, insulation, and structure. Its role in ensuring battery pack safety, enhancing BMS (Battery Management System) status awareness, and improving the reliability of vehicles and energy storage systems is becoming increasingly crucial, making CCS an irreplaceable core component in the new energy battery industry chain.

The continued growth in power battery installations is the primary driver of the CCS market. By 2025, global electric vehicle battery installations will exceed 1,000 GWh, and with the increasing scale of energy storage system deployments, the demand for CCS integrated busbar capacity is soaring. Furthermore, the automotive and energy storage industries' increasing standards for functional safety and precise BMS sensing are driving the upgrade of CCS from a basic conductive component to a highly integrated, multi-sensor, and highly reliable system-level product. Furthermore, the maturity of advanced manufacturing processes, automated assembly, and quality control capabilities enables CCS suppliers to provide high-volume customers with higher yields, more stable performance, and lower defect rates, constituting a medium-term growth driver for market expansion.

In the short term, CCS is further expanding from power batteries to energy storage and hybrid systems, with its penetration rate continuing to increase in high-voltage platforms (400V/800V) and large-capacity energy storage modules. In the medium term, as cell forms evolve towards blade batteries and high-energy-density pouch batteries, CCS design will also evolve from traditional rigid structures to flexible, adaptable, and highly modular designs. In the coming years, highly integrated signal acquisition and fault-tolerant design, as well as deep hardware and software co-optimization with BMS, will become the core of market competition, especially in scenarios with complex battery structures and high safety requirements, where module-level diagnostic capabilities will become standard for CCS. Meanwhile, for energy storage systems, the integration of safety management functions will become an important dimension differentiating

product value.

Despite strong demand, the CCS market faces multiple challenges. Firstly, fluctuations in material costs and the supply chain, such as the unstable prices of conductive materials like copper and aluminum, directly impact the cost structure and profit margins of CCS (Computer-Side Components). Secondly, with the diversification of battery module structures, pack architectures, and size designs, suppliers must provide diverse customized solutions, placing higher demands on production flexibility, engineering capabilities, and quality control. Furthermore, the quality and reliability of CCS are directly related to battery system safety; issues such as connection failures, signal loss, or localized overheating can trigger more serious systemic risks. Therefore, while expanding production capacity, suppliers must invest heavily in reliability verification, failure analysis, and full lifecycle testing.

Downstream battery OEMs and energy storage system integrators are shifting their demands for CCS from 'usable as is' to 'high reliability, high diagnostic capabilities, and high consistency.' In the power battery sector, OEMs are increasingly stringent on the lifecycle consistency requirements of CCS, driving CCS suppliers to shift from 'component supply' to 'system capability supply.' In the energy storage market, integrating functions such as cell connection, voltage/temperature monitoring, and automatic fuse/isolation mechanisms is becoming a mainstream trend, especially in the design of medium-to-large-scale energy storage power stations and hybrid energy storage systems. Overall, the development trend of the CCS market is towards high integration, high reliability, and deep synergy optimization with BMS. This trend not only increases the value per vehicle of CCS, but also lays the technological and demand foundation for its long-term growth.
