Synthesis of DNA from RNA through reverse transcription results in the production of complementary DNA (cDNA). The first strand cDNA is referred to the cDNA formed through reverse transcription of RNA using reverse transcriptases and primer complementary to the 3' end of the RNA. This first strand cDNA is then used as a template for PCR amplification of the cDNA as well as for synthesis of double stranded DNA. Reverse transcription PCR (RT-PCR) is commonly combined with real time PCR (qPCR) and is known as qRT-PCR.

cDNA reverse transcription kits are kits that contain all required mixes of reagents and enzymes required for the synthesis of cDNA and PCR amplification. Based on application there are a number of kits available in the market. Some of the applications include, library construction, small RNA cloning, subtractive hybridization, gene cloning, and florescent probe applications.
