In computer networking, a wireless access point (WAP), or more generally just access point (AP), is a networking hardware device that allows other Wi-Fi devices to connect to a wired network. As a standalone device, the AP may have a wired connection to a router, but, in a wireless router, it can also be an integral component of the router itself. An AP is differentiated from a hotspot which is a physical location where Wi-Fi access is available. Wireless access points work to extend the range of your network within a building, office, or home. In-ceiling wireless access points work like any other access device. However, they are meant to be mounted within or attached to the ceiling of a workspace. Mounting to the ceiling means that these wireless access points take very little space and are viable in almost any location.

The global market for Ceiling Mount Wireless Access Point is estimated to increase from US\$ million in 2021 to reach US\$ million by 2028, exhibiting a CAGR of % during 2022-2028.
