Cell cryopreservation solution is used to preserve living cells or tissue samples at extremely low temperatures (usually liquid nitrogen temperature, about -196°C). The main purpose of this preservation solution is to prevent cells from being damaged during the freezing and thawing process to ensure that they remain active and fully functional after long-term storage. Typical cell cryopreservatives usually contain the following ingredients: cryoprotectants, nutrients, buffers, preservatives, etc.

With the advancement of biomedicine and cell therapy technology, the global market for cell cryopreservation fluids is experiencing rapid growth. Cell cryopreservation fluids are widely used in stem cell research, cell therapy, and biobank management. As cell therapy technology matures, the demand for cell preservation and transportation is increasing. Especially in North America, Europe, and the Asia-Pacific region, the cell cryopreservation fluid market has been driven by the increasing demand for cell preservation by biotechnology companies and research institutions, which has promoted the expansion of the market size.

In addition, with the increasing requirements for safety and controllability, animal-free and serum-free cryopreservation fluids are gradually gaining favor in the market. These
