Cell-free cartilage repair refers to a regenerative treatment approach aimed at repairing damaged cartilage without the use of exogenously introduced cells. Instead of transplanting cells into the damaged area, this technique typically involves using scaffolds, growth factors, or other biological substances to stimulate the body's own repair mechanisms. The goal is to promote the regeneration of cartilage tissue naturally, thereby restoring joint function and reducing pain associated with conditions like osteoarthritis or cartilage injuries. This approach is often considered for its potential to avoid complications associated with cell-based therapies while offering a promising avenue for effective cartilage repair in orthopedic and sports medicine practices.

The global Cell Free Cartilage Repair market size is projected to grow from US\$ 989 million in 2024 to US\$ 1577 million in 2030; it is expected to grow at a CAGR of 8.1% from 2024 to 2030.
