The global Cell Gene Therapy Biomanufacturing market size is predicted to grow from US\$ 16520 million in 2025 to US\$ 33850 million in 2032; it is expected to grow at a CAGR of 11.0% from 2026 to 2032.

Cell and gene therapy (CGT) includes the injection of cells, genes, or gene-modified cells into a patient with the purpose of preventing or treating a disease. Cell therapy involves the injection of cells to replace or aid the repair of damaged cells, whereas gene therapy involves the injection of genes into cells to alter the genetic makeup of the recipient cells. Cell-based gene therapies, such as chimeric antigen receptor T (CAR-T) therapy, represent combinations of both approaches.

In recent years, the demand for cell and gene therapy (CGT) has surged as the number of United States Food and Drug Administration (U.S. FDA)-approved CGT products has increased annually. This increasing demand underscores the pressing need for manufacturers to improve and advance their production processes to keep pace with the rapidly evolving CGT field. The entire CGT manufacturing process must occur in a facility that complies with good manufacturing practice (GMP) regulations and has received full authorization to manufacture CGTs or advanced-therapy medicinal products, as they are referred to in Europe, for human use. Numerous clinical trials have been conducted to assess the safety and efficacy of CGTs for a wide range of clinical indications, including cancer.
