Cell staining machine is a laboratory instrument used to automate the cell staining process under a microscope. This machine helps to standardize the dyeing process and improve the accuracy and reproducibility of the results. This machine typically consists of a series of chambers or workstations for storing reagents used in the dyeing process, such as fixatives, dyes, and washing buffers. Place the cells to be stained on a slide or plate, and then load the slide or plate into the machine. Then, the machine automatically

distributes the appropriate reagents to the chambers or workstations, and moves the slide or plate through each workstation in a predetermined order. The dyeing process is usually controlled by software, which allows for precise control of the time and sequence of reagent allocation. This helps to ensure that all cells are evenly stained, and the staining process is repeatable from one experiment to the next.
