The global Cellular Residual Interleukin Detection Kit market size is predicted to grow from US$ 149 million in 2025 to US$ 333 million in 2032; it is expected to grow at a CAGR of 12.4% from 2026 to 2032.

The Cell Residual Interleukin Detection Kit is a bioanalytical reagent product used to detect the levels of residual human interleukins (such as IL-2, IL-6, and IL-15) during cell preparation. This kit is commonly used in the quality control and safety evaluation of cell therapy products, recombinant protein drugs, vaccines, and biological agents to ensure the effective removal of exogenous cytokines during the manufacturing process and avoid the risk of immune reactions. The detection principle is typically based on sandwich ELISA or chemiluminescent immunoassay, featuring high sensitivity, strong specificity, and good reproducibility. It can quantitatively determine the level of residual interleukins in samples, providing a scientific basis for release testing and process validation of biological products. In 2025, sales volume was 330,000 units, with an average price of US$422, a single-line production capacity of 30,000 units, and a gross profit margin of 80%.
