Cellulose is arguably the most abundant organic compound in the world, which has plants as its roots. Since it is a bio-based product, Cellulose has wide applications in the packaging industry. Cellulose derivative films are packaging films produced from cellulose functionalized in solvent state along with various side groups. Cellulose derivative films might include materials such as cellophane, cellulose acetate, methylcellulose, and carboxymethylcellulose. Cellulose derivative films possess good mechanical and barrier properties and are therefore used especially for packaging food. To talk about it more specifically, cellulose derivative films have traditionally been used for edible packaging. However, going by the present scale of research aimed at enhancing the barrier properties of cellulose derivative films, the prospects look promising. Research is being done on layering, blending, and filling cellulose derivatives with other synthetic polymers, thereby producing cellulose derivative films with enhanced mechanical strength. Improved barrier properties would widen the scope of applications for cellulose derivative films in the packaging industry.
