According to our LPI (LP Information) latest study, the global Cellulose Nanofibers (CNF) market size was valued at US\$ 87 million in 2023. With growing demand in downstream market, the Cellulose Nanofibers (CNF) is forecast to a readjusted size of US\$ 408 million by 2030 with a CAGR of 24.7% during review period.

The research report highlights the growth potential of the global Cellulose Nanofibers (CNF) market. Cellulose Nanofibers (CNF) are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Cellulose Nanofibers (CNF). Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Cellulose Nanofibers (CNF) market.

The terms cellulose nanofibrils and microfibrillated cellulose are being used interchangeably. There is considerable overlap in specifications, many of these materials contain a mix of nano-scale and micro-scale particles. Some producers prefer to call their material “nano” because it sounds more advanced, while others prefer to call it “micro” because of perceptions about environment, health, and safety issues. Both CNF and MFC are generally included in discussions of cellulose nanomaterials.

The properties of nanocellulose listed below: Lightweight, Stiffer than Kevlar®, Electrically conductive, Non-toxic; The crystalline form is transparent, and gas impermeable; It can be produced in large quantities in a cost-effective manner; it has a very high tensile strength - 8 times that of steel; it is highly absorbent when used as a

basis for aerogels or foams; the raw material - cellulose - is the most abundant polymer on earth.
