Cement tiles are a common building decoration material, which are usually made of cement, sand, mineral particles and other raw materials, and have decorative surface patterns such as patterns, patterns, and colors. During the production and manufacture of cement tiles, pressure molding, extrusion molding, manual splicing and other methods are usually used to make tiles with different specifications. Cement tiles not only have a beautiful decorative effect, but also have good durability and compression resistance. They can be used for decoration and paving of indoor and outdoor walls, floors, steps, railings and other positions.

According to the Japan Cement Association, Japan's cement industry emitted about 40 million tons of carbon dioxide in 2020. And the cement industry became the fourth largest source of carbon dioxide emissions in the industrial sector after electricity, steel and chemicals. 60% of the cement industry's carbon emissions come from process emissions, 35% from combustion emissions and 5% from indirect emissions from electricity. According to our "Building Materials Research Institute", the global clinker capacity in 2022 was about 3.55 billion tons, and the global cement production was about 4.0 billion tons. According to the National Bureau of Statistics, China's cumulative cement output reached 2.118 billion tons in 2022.
