The global Cement Static Gel Strength Measurement Device market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

A Cement Static Gel Strength Measurement Device, often referred to as a Static Gel Strength Measurement Device (SGSM), is a specialized instrument used in the oil and gas industry for testing and measuring the gel strength of well cement slurries under static conditions. This device plays a crucial role in evaluating the rheological properties of cement slurries used in wellbore construction and completion operations. The gel strength of a cement slurry is an essential parameter, as it affects the ability of the slurry to support the casing and maintain zonal isolation in the wellbore.

According to the Japan Cement Association, Japan's cement industry emitted about 40 million tons of carbon dioxide in 2020. And the cement industry became the fourth largest source of carbon dioxide emissions in the industrial sector after electricity, steel and chemicals. 60% of the cement industry's carbon emissions come from process emissions, 35% from combustion emissions and 5% from indirect emissions from electricity. According to our "Building Materials Research Institute", the global clinker capacity in 2022 was about 3.55 billion tons, and the global cement production was about 4.0 billion tons. According to the National Bureau of Statistics, China's cumulative cement output reached 2.118 billion tons in 2022.
