The global Center Type Rolling Bearings market size is predicted to grow from US\$ 899 million in 2025 to US\$ 1304 million in 2032; it is expected to grow at a CAGR of 5.6% from 2026 to 2032.

Center Type Rolling Bearings are one of the forms of sliding bearings. Its structure and working principle are similar to those of liquid sliding bearings. The difference is that gas (mostly air) is used as the lubricating medium. When the external compressed gas enters the bearing gap through the restrictor, a lubricating gas film with a certain load-bearing and rigidity will be formed in the gap, and the shaft will be floated in the bearing by the lubricating support of the gas film. For the gas static pressure bearing, the use of external pressure to supply air is its basic working method, and the restrictor is the key to its structure, and the eccentricity of the main shaft due to its own weight and load during operation establishes the corresponding bearing and rigidity machining center mechanism of the bearing.

The output of the global bearing market shows an increasing trend year by year. In 2019, the output of the global bearing market reached approximately US\$105.5 billion. In 2020, due to the impact of the COVID-19 epidemic, the output of the bearing market dropped by approximately 5%. However, as the global economy gradually recovers, the output of the bearing market is expected to increase and is expected to reach approximately US\$150 billion in 2023. The output value of the global bearing market has also shown an increasing trend year by year. In 2019, the output value of the global bearing market reached approximately US\$34 billion. By 2020, due to the impact of the COVID-19 epidemic, the output value of the bearing market dropped by approximately 8%. As the global economy gradually recovers, the output value of the bearing market is expected to grow and is expected to reach approximately US\$42 billion in 2023.
