A centering bar is a jig that detects the origin position of a machine tool on a flat surface with a high accuracy.

The centering bar is held by the machine tool and moved slowly toward the edge of the workpiece while the spindle is rotating, until the eccentricity of the centering bar, which is in contact with the workpiece, is completely eliminated. The position where the runout is completely eliminated can be defined as the origin. This is an important item because the accuracy of the origin is directly related to the accuracy of machining.

Origin positioning by the touch sensor is also available. While touch sensors are convenient, it takes time and effort to compensate for any abnormality that may occur.
