Centralized BDU, also known as Battery Disconnect Unit (BDU). The Battery Disconnect Unit (BDU) in an electric vehicle (EV) essentially acts as an on/off switch to the battery for different EV operating modes. In addition, the BDU distributes and protects power within the EV system. The BDU is functioning throughout several modes of operation including charging, driving, accelerating and decelerating (or regenerating power). disconnect power to ensure the safety of the occupants and other components.

The Centralized Battery Disconnect Unit (BDU) market focuses on integrated electronic systems designed to manage and control the distribution, isolation, and protection of high-voltage battery power in electric vehicles (EVs) and hybrid vehicles. A centralized BDU consolidates key functions—such as contactor control, pre-charge circuits, current sensing, and safety disconnection—into a single compact unit, improving system efficiency, safety, and space utilization. It plays a critical role in monitoring battery status, protecting against overcurrent or short circuits, and enabling safe power shutdown during maintenance or emergencies. With the ongoing shift toward electrification in automotive and industrial applications, centralized BDUs are increasingly favored for their simplicity, reliability, and ease of integration into advanced battery management systems.
