The centralized converter and boost system is an integrated power device that is mainly used to convert direct current from multiple energy units (such as photovoltaic modules or wind turbines) into alternating current through a centralized converter, and use a step-up transformer to increase its voltage to a level suitable for grid-connected transmission. The system is widely used in renewable energy power generation scenarios such as large-scale photovoltaic power stations and wind farms. It can efficiently integrate decentralized energy inputs, optimize power quality, and achieve stable connection with the power grid. The centralized converter and boost system has become a key technical solution for large-scale energy generation and grid connection with its high power density, reliability and economy.
