## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Centrifugal brakes are brakes that produce a braking function by means of centrifugal force.

A centrifugal brake has a fixed drum with a unit assembly set inside the drum. When the unit assembly is rotated, centrifugal force will raise all the brake shoes. Then, the lining will be pressed (pressurized) against the inner surface of the drum, which will cause a braking effect on the rotating shaft.
