Various industrial colloids will always produce certain bubbles during the preparation process. In order not to affect the use of the colloid, it is necessary to remove the air bubbles. The usual method is to use a centrifuge to drive the air bubbles. Centrifugal defoaming machine is to use centrifugal method to separate the air bubbles in the material with the help of centrifugal force. When the material rotates at high speed in the centrifugal degassing machine, a centrifugal force is generated, which separates the material from the air bubbles in it, and finally achieves the effect of degassing.
