## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Centrifugal dehydrator is mainly composed of conveyor and screw conveyor with hollow shaft. After the sludge is fed into the drum through the hollow shaft, it is thrown into the inner cavity of the drum under the action of centrifugal force. Sludge particles are thrown onto the inner wall of the wheel hub to form a solid layer, while only a liquid layer is generated inside the solid layer. The sludge in the solid layer is slowly transported to the conical end of the conveyor driven by the screw conveyor and continuously discharged through the outlet around the conveyor. The larger the diameter of the hub, the greater the dewatering capacity. The longer the reprint length, the higher the solid content of sludge. The centrifugal dehydrator has the disadvantages of high noise, high energy consumption and low treatment capacity. At present, China can only produce small centrifugal dehydrators, and large centrifugal dehydrators can only rely on imports.
