The global Centrifugal Dental Casting Machine market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

A centrifugal dental casting machine is a dental technical device used for the fabrication of dental restorations such as crowns and bridges. Based on the principle of centrifugal force, the equipment injects molten metal or alloy into the mold, and rotates the mold at high speed to fill the mold space with metal or alloy, and finally make a restoration. Centrifugal dental casting machines usually consist of an electric motor, centrifugal rotor and wax injector. First, a mold is made on the tooth and a wax sample is injected into it. Then attach the wax injector to the centrifuge rotor and spin the rotor to high speed. During rotation, molten metal or alloy is injected into the wax injector and fills the mold space by centrifugal force. Finally, the mold is removed from the centrifugal dental casting machine, from which the wax sample is removed and subjected to subsequent processing such as sintering, polishing and mounting.
