The global Centrifuges for the Mineral Processing market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Centrifuges in mineral processing are specialized machines used to separate particles of different densities within a slurry or suspension by applying centrifugal force. They operate at high rotational speeds, creating a force that pushes heavier particles outward and lighter particles inward. This enables efficient separation, thickening, and dewatering of minerals such as coal, ores, and sand, commonly used in mining and refining industries. By concentrating valuable minerals and removing water from waste material, centrifuges improve recovery rates, reduce handling costs, and optimize downstream processing steps.
