Ceramic beads blasting medium, also known as ceramic blasting media or ceramic beads, is a type of abrasive material used for abrasive blasting processes. It is composed of small, spherical beads made from ceramic materials, typically zirconium oxide or aluminum oxide. The beads are manufactured through a process of sintering or melting ceramic powders to form uniform spheres.

Ceramic beads are known for their hardness, making them effective for removing surface coatings, contaminants, and burrs from various materials. They are durable and resistant to breakage, providing a longer lifespan compared to some other blasting media. Ceramic beads have a high density, allowing them to deliver energy efficiently

during the blasting process.

They are chemically inert, which means they do not react with the surfaces being blasted. The spherical shape and consistent size of ceramic beads contribute to uniform and controlled blasting, reducing the risk of substrate damage. Ceramic beads can often be recycled and reused multiple times, reducing waste and overall operational costs.

Applications of ceramic beads blasting medium include: surface cleaning, surface finishing, shot peening, etc.
