The global Ceramic Composition Resistors market size is predicted to grow from US\$ 103 million in 2025 to US\$ 151 million in 2032; it is expected to grow at a CAGR of 5.7% from 2026 to 2032.

Ceramic Composition Resistors are solid fixed resistors made by uniformly mixing fine insulating ceramic powder with conductive oxides, carbon particles, etc., as the resistive element, sintering at high temperature, and assembling metal electrodes. They feature high pulse resistance, high temperature resistance, high stability, and non-inductance?Resistance is controlled by the ratio of insulator to conductor mixture. In 2025, global Ceramic Composition Resistors production reached approximately 137.1 M Units. The industrial chain of ceramic composition resistors consists of upstream core electronic ceramic powders, conductive phase materials, binders, electrode materials and production equipment; midstream is resistor R&D and manufacturing enterprises; downstream covers industrial control, medical equipment, new energy, communications, automotive electronics and other fields.

The growth of the Ceramic Composition Resistors market is primarily driven by the increasing demand for high-power and high-reliability passive components in power electronics systems. As applications such as industrial power supplies, energy storage systems, and rail transit electrification continue to expand, there is a rising need for resistors capable of handling high energy absorption, strong surge currents, and extreme thermal stress. Ceramic Composition Resistors, with their bulk conductive network structure and superior thermal stability, are well-suited for these demanding environments, making them a preferred choice in high-power circuit protection and energy dissipation applications.
