The global Ceramic Fiber Board market size is predicted to grow from US\$ 650 million in 2025 to US\$ 925 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

In 2025, global ceramic fiber board production reached approximately 9500 k pcs, the average price is 70 usd/pc. Ceramic fiber board is a rigid, plate-shaped refractory and heat-insulating material made by adding a small amount of organic or inorganic binder to ceramic fibers and then processing it through pulping, molding, and drying. It features light weight, high temperature resistance, low thermal conductivity, good thermal stability, and strong thermal shock resistance. It can maintain structural strength and heat insulation performance in high-temperature environments and is commonly used for heat insulation, refractory lining, or structural panels in industrial kilns, heat treatment equipment, fireproof partitions, and high-temperature pipeline insulation.

Market Concentration and Major Players:

Internationally, the ceramic fiber board market is highly concentrated, mainly in developed countries such as Europe and the United States. Large manufacturers include companies like Nutec and JAINCO. Domestically, the ceramic fiber board market still has significant room for growth.

Manufacturing Process and Market Trends:

The manufacturing process involves melting raw materials such as alumina and silica at high temperatures, then blowing or spinning them into ceramic fibers. After slag removal, the fibers are mixed with binders, fillers, and water to form a pulp. This pulp is then shaped using a vacuum filtration wet or dry pressing method. The wet method requires dehydration and demolding, while the dry method involves direct pressing. The

pulp is then dried in a drying oven and heat-treated for shaping. Finally, the edges are trimmed and quality is inspected to obtain the finished product.

Driven by policies promoting industrial kiln renovation and energy conservation, the market continues to replace traditional heavy refractory materials. Applications are expanding from metallurgy and chemical engineering to fields such as new energy battery insulation, environmental protection filtration, and aerospace thermal protection. In the future, the focus will be on developing high-purity, low-slag balls and nanocomposite modified products to improve strength and insulation, and optimizing low-energy consumption and low-emission processes in line with the trend of green manufacturing. At the same time, the market is developing towards lightweight, multifunctional, and customized products to meet the needs of high-end equipment.
