The global Ceramic GOS Scintillator market size is predicted to grow from US\$ 491 million in 2025 to US\$ 693 million in 2031; it is expected to grow at a CAGR of 5.9% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Ceramic GOS scintillator is a material with excellent scintillation properties. Its main component is Gd₂O₃. It is widely used in radiation detection, nuclear medical imaging and industrial detection. Its main luminescence peak is at 512 nm, and it has excellent properties such as high light output, high density (7.34 g/cm³), and short afterglow (less than 0.1% and 3 ms). GOS ceramics are translucent, moisture-resistant, non-toxic and easy to process. Different dopants have different luminescence properties. GOS ceramics belong to the hexagonal crystal system, are anisotropic, and exhibit birefringence at the grain boundaries, which makes the preparation of transparent ceramics more difficult. Its high light output and high density characteristics make it of great value in applications such as X-ray detectors, foreign body detectors, and radiation detection.

United States market for Ceramic GOS Scintillator is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
