Thick film ceramic substrate refers to ceramic substrate processed by thick film technology. The thick film ceramic substrate is a post-fired ceramic substrate. 'Thick Film' refers to the thickness of conductor layer on Ceramic Substrate. Normally the thickness will be at least exceeds 10 micron (um), around 10~100um, more thick than sputtering technology in Thin Film Ceramic Substrate. Of course thickness is less than DCB Ceramic board or FR4 board.

At the same time, using thick film technology, we can put resistor, electric capacity, conductor, semi-conductor, and interchangeable conductor on ceramic board, after manufacturing steps of printing and high temperature sintering. We can make all the resistors with the same value, or different value for different resistor on the same board.

Due to the mature technology, simple process and low cost, thick-film ceramic substrates have been applied in electronic packages that do not require high graphics accuracy.

In general, the thick film ceramic substrate covers Alumina (Al₂O₃) thick film substrates, AlN thick film substrates and BeO thick film Substrates.

This report studies the thin film ceramic substrates, mainly covers the Alumina thin film substrates, and AlN thin film substrates. Mainly used in Automotive & Sensors, Industrial & Medical, Power Device, LEDs, MEMS Packages, Oscillators, Fuses, Military & Defense, etc.
