Ceramic pressure casting machine is a machine used to make different types of ceramic products such as ceramic tableware, cookware, ceramic sanitary ware, technical and advanced ceramics, hand formers, dental products, personal protection products, and body armor with high efficiency in their final shape and even geometries. Ceramic pressure casting machines use resin porous molds by high-pressure injection of clay slip. The machines are used to form the products in medium and large quantities and in a cost-efficient manner without compromising on quality. Ceramic pressure casting machines are used in both core casting systems and hollow casting systems. The machines, when compared to the conventional and plaster casting process, offer several significant advantages such as low casting time, more uniform product, tighter dimensional tolerances, negligible contamination, long mold life, improved surface finish and product quality, higher output, environment friendliness, less energy consumption, less water usage, and lower mold disposable cost.
