Ceramic pumps are actually piston pumps. Functionally, it is an important device of the hydraulic system. Since ceramic is a material with excellent corrosion resistance and wear resistance, the pump body and pump cover of the ceramic pump are made of acid-resistant ceramic, taking full advantage of this property. It relies on the reciprocating motion of the plunger in the cylinder to change the volume of the sealed working chamber to achieve the suction and discharge of liquid. Ceramic materials are the most rigid and hardest materials among engineering materials. They are not easily oxidized at high temperatures and have good corrosion resistance to acids, alkalis, and salts. Therefore, the quality of ceramic materials has a great impact on the operation of ceramic pumps.

The global Ceramic Pump market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
