The gross margin of major industry players was approximately 25%-45%. A Ceramic Substrate Cutting Machine is a specialized piece of equipment used for precision singulation and forming of electronic ceramic substrates. It mainly performs cutting, scribing, grooving or hole drilling on ceramic substrates such as alumina, aluminum nitride, silicon nitride, zirconia, LTCC/HTCC, and DBC/AMB substrates through laser cutting or diamond blade dicing. The equipment can process whole ceramic substrates into specified sizes and structures, featuring high processing precision, stable kerf quality and stringent edge-chipping control requirements. It is mainly used in RF communications, automotive electronics, photovoltaics and aerospace electronics.

Its upstream mainly includes key components such as lasers, cutting heads, diamond blades, spindles, precision guide rails, servo motors, vision positioning systems, vacuum chuck platforms, control systems and machine frames. The midstream involves the design, assembly, commissioning and process adaptation of ceramic substrate cutting equipment. The downstream mainly serves ceramic substrate manufacturers, power semiconductor packaging companies, LED packaging companies, electronic ceramic device manufacturers and high-reliability electronic module manufacturers.
