A ceramic knee joint is an artificial prosthesis used to replace a damaged or painful knee joint. Compared with traditional metal or plastic artificial knee joints, ceramic artificial knee joints have higher hardness and wear resistance, as well as a lower coefficient of friction. This makes the ceramic artificial knee joint have better durability and less wear, helping to reduce joint wear and artificial joint failure caused by material fatigue. In addition, ceramic artificial knee joints also have good biocompatibility and fewer allergic reactions, which can reduce the risk of postoperative complications. Therefore, ceramic artificial knee joints have gradually become one of the important choices for artificial knee replacement surgery.

The global Ceramics Artificial Joints of Knee market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
