## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Ceramides are a family of waxy lipid molecules. A ceramide is composed of sphingosine and a fatty acid. Ceramides are found in high concentrations within the cell membrane of cells. They are one of the component lipids that make up sphingomyelin, one of the major lipids in the lipid bilayer. Contrary to previous assumptions that ceramides and other sphingolipids found in cell membrane were purely structural elements, ceramide can participate in a variety of cellular signaling: examples include regulating differentiation, proliferation, and programmed cell death (PCD) of cells.

The global Ceramide market size is projected to grow from US\$ 368 million in 2024 to US\$ 521 million in 2030; it is expected to grow at a CAGR of 6.0% from 2024 to 2030.
