## Abstracts

The global Cervical Human Spinal Column Model market size is predicted to grow from US\$ 363 million in 2025 to US\$ 546 million in 2032; it is expected to grow at a CAGR of 6.5% from 2026 to 2032.

In 2025, global Cervical Human Spinal Column Model production reached approximately 3.1 M Units. The average price is approximately \$120. Cervical Human Spinal Column Model refers to a three-dimensional anatomical teaching model that replicates the cervical portion of the human spine, typically including the seven cervical vertebrae (C1-C7) and often associated structures such as the occipital bone, intervertebral discs, spinal cord, nerve roots, vertebral arteries, ligaments, and surrounding muscles.

### Gross Profit Margin Level

From the perspective of gross profit margin structure, cervical spine human spinal models belong to the typical anatomy teaching aid sector characterized by 'low material costs, high knowledge display value, and clear SKU stratification.' Basic PVC teaching models typically have lower prices at the Asian OEM end, but after entering European and American brand channels, the retail price increases significantly due to factors such as mold precision, painting process, anatomical markings, teaching manuals, after-sales service, and brand premium. Further adding functions such as muscle, nerve, vertebral artery, brainstem, pathological structures, or surgical simulation can significantly increase the unit price. Overall, a gross profit margin of 45%-60% is reasonable for this industry: approximately 35%-50% for standard teaching models, approximately 50%-65% for mid-to-high-end brand teaching models, and 60%-75% for surgical simulation/advanced pathology demonstration products. However, this high gross profit

margin does not equate to high net profit, as R&D prototyping, mold maintenance, small-batch production, international channel distribution, and after-sales support also simultaneously increase operating expenses. The above assessment aligns with the current market's clear price gradient, ranging from \$20-40 OEM products to \$60-130 branded standard models, and then to high-end models priced above \$300.

## Industry Drivers

The growth of the cervical spine human spinal model industry is primarily driven by three converging forces. First, the routine procurement for medical and vocational education; medical schools, nursing, rehabilitation, physical therapy, and spinal therapy specialties all require physical models that can be repeatedly manipulated and provide a direct visual representation of the relationship between nerves and bony structures. Second, the increasing demand for clinical communication; hospital orthopedics, pain management, rehabilitation, and spinal specialists are placing greater emphasis on patient education, using cervical spine models to explain disc herniation, nerve compression, vertebral alignment, and surgical pathways, achieving significantly higher communication efficiency than two-dimensional images. Third, the continued strengthening of the trend towards cadaver-free/low-cadaver-dependent surgical training; most manufacturers are upgrading their products from ordinary display teaching aids to simulation platforms that more closely resemble surgical practice, pathological demonstrations, and operable training. At the same time, Chinese and Indian OEMs continue to drive down the supply costs of basic models, which has led to a continued increase in the penetration rate of this product category in global schools and distribution networks.
