Cervical Non-Fusion Spinal Implant is a medical device used in cervical spine surgery to provide dynamic stabilization as an alternative to traditional rigid fusion. It preserves natural motion (e.g., flexion, extension, rotation) of the cervical spine while maintaining spinal stability, thereby reducing the risk of adjacent segment degeneration (ASD). Common designs include artificial disc replacement (ADR) or dynamic stabilization systems (e.g., interspinous spacers). It is primarily indicated for cervical degenerative diseases (e.g., herniated disc, cervical spondylosis) to improve postoperative quality of life.
