The global CFSE Cell Proliferation Kit market size is predicted to grow from US\$ 299 million in 2025 to US\$ 390 million in 2032; it is expected to grow at a CAGR of 3.9% from 2026 to 2032.

Amine-reactive dye CFSE (carboxyfluorescein diacetate, succinimidyl ester, also known as CFDA-SE) is widely used in cell proliferation and in vivo cell tracking. CFSE is non-fluorescent until it enters viable cells, where it is hydrolyzed by cytoplasmic esterase enzymes to release fluorescent amine-reactive dyes. These dyes then covalently react with the amine groups on intracellular proteins to form fluorescent conjugates that are retained in the cells. Moreover, due to this stable linkage, once the dyes are incorporated into the cells, they do not transfer to adjacent cells. CFSE was originally developed to track lymphocyte migration. Subsequent studies revealed that this dye can be used to monitor cell proliferation both in vitro and in vivo, as CFSE fluorescence in progeny cells was gradually halved as the cells division.

United States market for CFSE Cell Proliferation Kit is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
