The global cGMP Lentivirus Production market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Lentiviruses are a subclass of retroviruses, but unlike other retroviruses, lentiviruses can integrate into the genome of non-dividing cells. As retroviral vectors, lentiviral vectors never contain genes for replication. Therefore, production of lentivirus requires propagation in packaging cell lines (e.g., HEK293 cells transfected with plasmids encoding virion proteins). The Lentiviral Production System is an early optimized system that provides a scalable, high-throughput lentiviral vector production platform. Compared with retroviral vectors produced in stable cell lines, clinical-grade lentiviruses are mostly produced by transient transfection of 293 or 293T cells in cell factories. However, recent advances have favored the use of hollow fiber tube reactors, suspension culture, and improved stable cell line production.

United States market for cGMP Lentivirus Production is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for cGMP Lentivirus Production is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
