A chain coupling is a mechanical device that transmits torque and rotational motion by connecting two toothed hubs (sprockets) via a chain. It utilizes the meshing between the chain and the sprocket to not only effectively transmit power, but also compensate for angular, radial and axial misalignment between shafts within a certain range. Chain couplings are widely used in various industrial transmission systems, such as pumps, compressors, conveyors and other equipment, due to their simple structure, easy installation and maintenance, high cost-effectiveness and certain shock absorption performance. They are suitable for light to medium load applications.

United States market for Chain Coupling is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
