A Chain Support Buoy is a floating device used in marine and offshore applications to provide buoyancy and support to anchor chains, risers, or mooring lines. Positioned in the water column, the buoy reduces tension on the chain or cable by counteracting its weight, thus preventing excessive sagging or abrasion on the seabed. This is critical in maintaining the structural integrity of mooring systems, especially in harsh marine environments where currents and waves exert significant forces. Chain support buoys are commonly used in oil and gas platforms, floating production systems, and other offshore installations to ensure stability and longevity of mooring components.
