People have been working to make all the devices on the desktop wireless, from wireless networks to screencasting, from wireless mice to Bluetooth speakers, but wireless technology only solves the problem of data signal transmission between devices. These devices still need a wire. To provide power. Until the popularity of wireless charging technology, we can finally get rid of the constraints of the wire. However, due to the bottleneck of technology development, wireless charging still needs close contact between devices to achieve. For most commonly used devices, the existing wireless charging technology brings an improvement in the experience. However, the wireless mouse is an exception. The combination of a wireless mouse and a wireless mouse pad can solve the problem that wireless mice often need to be charged in wired mode.
