The automotive chassis module provides the required strength to support a vehicle's components and the payload placed upon it. The suspension system contains the shock absorbers, springs, and other components that allow the vehicle to pass over uneven terrain without facing an excessive amount of shock due to the passengers or cargo. The steering mechanism is a significant portion of the chassis, as it provides the driver with a means to control the direction of travel. The tires grip the road surface to provide a good control that enables the vehicle to accelerate, brake, and make turns without skidding. Chassis module working along with with the suspension, the tires absorb most of the shocks caused by road irregularities. The body of the vehicle contains the

mechanical components and passenger compartment. It is produced of relatively light sheet metal or composite plastics. The components which make the chassis are held together in proper relation to each other by the frame.
