Chelated trace minerals for feed refers to the addition of compounds formed by chelating trace minerals and organic molecules to animal feed to improve the absorption and utilization of these trace minerals by animals.

Trace minerals are one of the essential nutrients in animals, including iron, manganese,

copper, zinc, selenium, iodine and cobalt. They participate in a variety of physiological processes in animals, such as enzyme synthesis, immune response, reproductive process, etc. However, due to the low content of trace minerals in natural feeds and the tendency to interact with other ingredients to lose their biological activity, it is necessary to add an appropriate amount of trace minerals to the feed.
