The global Chelated Trace Minerals for Feed market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Chelated trace minerals for feed refers to the addition of compounds formed by chelating trace minerals and organic molecules to animal feed to improve the absorption and utilization of these trace minerals by animals.

Trace minerals are one of the essential nutrients in animals, including iron, manganese, copper, zinc, selenium, iodine and cobalt. They participate in a variety of physiological processes in animals, such as enzyme synthesis, immune response, reproductive process, etc. However, due to the low content of trace minerals in natural feeds and the tendency to interact with other ingredients to lose their biological activity, it is necessary to add an appropriate amount of trace minerals to the feed.

According to our Fee Research Center, in 2022, global total production of feed was about 1.2 billion tons. Key producing regions are Asia, Europe and North America, top ten countries hold about 65% of global feed production. China, United States, Brazil and India, as the top four countries, accounted for half of the total feed production.
