The global Chemotherapy Induced Nausea and Vomiting (CINV) Drugs market size is predicted to grow from US\$ 2197 million in 2025 to US\$ 2855 million in 2031; it is expected to grow at a CAGR of 4.5% from 2025 to 2031.

Chemotherapy-induced nausea and vomiting (CINV) is a common side-effect of many cancer treatments. Nausea and vomiting are two of the most feared cancer treatment-related side effects for cancer patients and their families. In 1983, Coates et al. found that patients receiving chemotherapy ranked nausea and vomiting as the first and second most severe side effects, respectively. Up to 20% of patients receiving highly emetogenic agents in this era postponed, or even refused, potentially curative treatments. Since the 1990s, several novel classes of antiemetics have been developed and commercialized, becoming a nearly universal standard in chemotherapy regimens, and helping to better manage these symptoms in a large portion of patients. Efficient mediation of these unpleasant and sometimes crippling symptoms results in increased quality of life for the patient, and better overall health of the patient, and, due to better patient tolerance, more effective treatment cycles.

Global Chemotherapy Induced Nausea and Vomiting (CINV) Drugs key players include Merck, Eisai, Mundipharma, etc. Global top three manufacturers hold a share over 50%.

North America is the largest market, with a share about 50%, followed by China, and Europe both have a share about 35 percent.

In terms of product, 5-HT3 Inhibitors is the largest segment, with a share over 60%. And

in terms of application, the largest application is Moderately Emetogenic Chemotherapy, followed by Highly Emetogenic Chemotherapy, Low Emetogenic Chemotherapy, etc.
