The global Chemical Delivery Systems market size is predicted to grow from US\$ 1230 million in 2025 to US\$ 1939 million in 2032; it is expected to grow at a CAGR of 7.3% from 2026 to 2032.

Chemical Delivery Systems is a system that continuously supplies chemicals to the production line. The chemicals supplied by the supply system are generally used in large quantities or supplied by multiple devices, and belong to long-distance transportation. They are not suitable for chemicals with low usage or limited storage time before use (usually requiring special packaging to transport them to the point of use). These chemicals are generally transported to areas such as wet etching and cleaning. In 2025, global Chemical Delivery Systems production reached approximately 3,048 Units, with an average global market price of around K US\$ 412 per unit.

With the development of chip processing towards 7nm, 5nm and below nodes, the limits for trace pollutants such as process chemicals, ultra pure gases and deionized water particles, metal ions, organic matter, etc. continue to tighten, directly driving the demand for high reliability, low pollution transport pipelines, point filtration and online monitoring systems. The high-purity conveying system is not only a key link in ensuring device yield, but also a technical facility that must be invested by OEM/packaging factories and material supply chains to meet process specifications. Therefore, it brings a large market space for system design, validation, and operation services that comply with SEMI series standards (such as E49/F31/F41, etc.).

Europe, America, East Asia, and Southeast Asia have plans to expand or build wafer fabs at different stages, and many countries consider the semiconductor industry as a strategic industry (supported by government investment, subsidies, and industry funds).

This brings a large number of opportunities for chemical conveying systems, POU systems, chemical packaging and storage engineering projects, especially in the stage of new production lines, which require the integration of suppliers (including EHS management and waste liquid treatment) for large-scale and integrated delivery.

In addition to traditional integrated circuits, the rapid development of emerging industries such as third-generation semiconductors (silicon carbide, gallium nitride) and new display panels (OLED, Micro LED) has opened up new incremental markets for chemical delivery systems. These fields have varying demands for special gases and advanced materials, such as high-temperature precursors required for silicon carbide epitaxial growth, and special requirements for the high temperature resistance and stability of transport systems. At the same time, the increasing regulatory pressure on carbon reduction and consumption reduction in the manufacturing industry worldwide is driving semiconductor factories to seek more energy-efficient and environmentally friendly chemical management solutions. This promotes the upgrading of the conveying system towards a green and low-carbon direction, such as replacing traditional pneumatic pumps with electrically driven diaphragm pumps, which can significantly reduce energy consumption and noise, and achieve integration with factory energy management systems, in line with the long-term trend of sustainable development in the industry.
