Chemical grain fumigants are chemicals used to control pests in stored grains. These fumigants are usually highly toxic and volatile, and can kill or repel insects, fungi, bacteria and other pests at specific concentrations and conditions, thereby protecting grains from damage and preventing the spread of pests.

The fumigation process is usually carried out in sealed containers or buildings to maintain the concentration of the fumigant and prevent leakage. When using these chemicals, it is necessary to comply with national and regional laws and regulations and take appropriate safety measures, such as wearing personal protective equipment, ensuring good ventilation conditions, and conducting appropriate decontamination and ventilation procedures after fumigation.
