Chemical organic UV filters, also known as organic sunscreen filters or simply chemical UV filters, are compounds used in skincare products to shield the skin from the harmful effects of ultraviolet (UV) radiation emitted by the sun. Unlike physical UV filters, which create a barrier on the skin's surface to reflect and scatter UV rays, chemical organic UV filters function by absorbing UV radiation and converting it into less harmful forms of energy, such as heat or infrared radiation. These filters typically consist of organic compounds with conjugated double bonds or aromatic rings, which enable them to effectively absorb UV radiation. Examples of chemical organic UV filters include avobenzone, oxybenzone, octocrylene, and octinoxate. Chemical organic UV filters are often included in sunscreen formulations to enhance their ability to block both UVA and UVB rays. They are preferred by some individuals for their lightweight and transparent nature, which allows for easier application without leaving a noticeable residue on the skin.

The global Chemical Organic UV Filter market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
