## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Chemically absorbed sunscreen, also known as chemical sunscreen, contains organic (carbon-based) compounds that absorb ultraviolet (UV) radiation and convert it into heat, which is then released from the skin. Common active ingredients in chemical sunscreens include avobenzone, octinoxate, oxybenzone, and octocrylene. These sunscreens are typically lighter in texture and easier to apply evenly compared to physical sunscreens, which use mineral-based ingredients like zinc oxide or titanium dioxide to physically block UV rays. Chemical sunscreens provide broad-spectrum protection against both UVA and UVB rays and are often preferred for daily use due to their non-whitening appearance on the skin. However, they may cause skin irritation in some individuals and require reapplication more frequently, especially after swimming or sweating.

The global Chemically Absorbed Sunscreen market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
