Chemicals boiling stones, also known as boiling chips or anti-bumping granules, are small, porous stones or chips commonly added to a liquid to promote smooth boiling and prevent sudden, vigorous boiling known as bumping. Made of inert materials like porcelain or glass, they provide nucleation sites for bubbles to form, facilitating even boiling and preventing superheating of the liquid. Chemicals boiling stones are widely used in laboratories during distillation, reflux, and other heating processes to ensure safe and efficient operations. By reducing the risk of bumping, they help maintain temperature control, improve reaction efficiency, and minimize the likelihood of sample loss or contamination.

The global Chemicals Boiling Stones market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
