The global Chemiluminescence Ammonia Analyzer market size is predicted to grow from US\$ 176 million in 2025 to US\$ 250 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

A chemiluminescence ammonia analyzer is an environmental monitoring instrument used for the precise and continuous determination of ammonia concentration in gas samples. Based on the physical phenomenon of chemiluminescence, its core reaction involves a gas-phase chemical reaction between ammonia and ozone. During the reaction, some ammonia molecules are excited to a high-energy state. When they return to their ground state, they release energy as photons, producing light of a specific wavelength (mainly in the near-infrared region). The demand primarily stems from the urgent need for refined atmospheric environmental management and scientific research. Specific driving factors include: the need to monitor ammonia, a key precursor to haze (PM2.5) and ozone pollution, for precise source tracing and control; assessing the effectiveness of agricultural ammonia emission reduction and atmospheric nitrogen deposition flux; and continuous online monitoring of industrial emissions (such as fertilizers, livestock farming, and chemicals) to meet increasingly stringent environmental regulations. Its upstream supply chain focuses on high-precision optical and electronic components (such as photomultiplier tubes, lasers, catalytic converters, dedicated chips and sensors), specialty materials and gases (high-purity ozone generators, reaction chamber materials, standard gases), and precision machining. Downstream, it directly serves environmental monitoring stations, research institutions, industrial parks, and third-party testing companies, extending into data services, operation and maintenance calibration, and system solutions. In 2025, the production volume of chemiluminescence ammonia analyzers is approximately 3,000 units, with an average price of approximately US\$60,000 per unit, a gross profit margin of

approximately 55%, and a single-line capacity of 100 units per year.
