Chemiluminescent immunoassay (CLIA) offers significant advantages over traditional assay detection methods. Rather than using messy isotopic detection, or chromogens such as TMB or ABTS that require absorption spectroscopy, CLIA kits utilize chemical reactions that produce light. Measurement of light is highly useful because the concentration of an unknown can be inferred from the rate at which light is emitted. Extraordinary sensitivity, low background, a wide dynamic range, and inexpensive instrumentation distinguish luminometry from other analytical methods.
